CME for 15.2

- Factors that may be associated with medication non-adherence in the elderly include:
 - Increased susceptibility to drug-related complications due to pharmacodynamic and pharmacokinetic changes
 - Multiple diseases that require polypharmacy and cause functional limitations
 - Increased risk of drug interactions
 - Receiving healthcare services across multiple providers
 - All of the above
- Functional independence measure (FIM) is an 18-item, clinician-reported scale that assesses the severity of the patient disability and functional outcome of medical rehabilitation. The FIM includes the following items EXCEPT:
 - Bladder management
 - Bowel management
 - Walk/wheelchair
 - Stairs
 - Jogging
- The Clinical Dementia Rating (CDR) was originally developed as a staging tool to categorize the overall severity of dementia. It consists of six cognitive and behavioral domains, including:
 - Memory
 - Orientation
 - Community affairs
 - Personal care
 - All of the above
- Which of the following statements regarding the postoperative pulmonary infection in elderly patients is INCORRECT:
 - The clearing function of airway cilia, cough ability, and sputum excretion ability decline with aging
 - Higher risk of postoperative infection due to the decline of somatic and immune functions
 - The coexistence of multiple diseases may lead to a decrease in reactivity to pathogenic bacteria and drugs
 - Hidden clinical symptoms and/or occult lesions may increase the difficulty of making a definitive diagnosis
 - Patients with abdominal obesity usually have a higher lung reserve capacity
- The WHO Quality of Life-BREF is simplified from the original six domains of WHOQOL-100 to a 26-item questionnaire of the following domains:
 - Physical health
 - Psychological health
 - Social relationships
 - Environmental health
 - All of the above
