Digitalization Keeps Accelerating in Reshaping the Healthcare Services

The growth of digital medicine has accelerated after COVID-19. People have gradually become accustomed to employing the convenience of information technology to deal with medical problems. At the same time, the maturity of many other digital tools, such as wearable devices, virtual reality (VR), augmented reality (AR) and mixed reality (MR), etc., are within the reach of our real life applications in providing healthcare. The exploration of application in medical scenarios and its empirical evidence in VR, AR and MR will grow rapidly. These technologies will not be limited to teaching, training, advanced surgical simulation, neurorehabilitation, and psy-

chotherapy. It will be interesting to see how digital transformation will affect medical outcomes and quality of care.
